We want to take pictures of your child’s brain!

The Petersen/Schlaggar lab at Washington University is recruiting healthy children between age 8-13 to participate in a research study on the development of the neural mechanisms for language processing. Using functional MRI, we hope to uncover how language processing differs between typically developing children, children with language impairment, and healthy adults.

Your child can participate in imaging sessions and behavioral testing and make between $75-$140. Your child will also get a printed picture of his or her own brain!

Before enrolling in this study, we do screening over the phone and ask guardians of interested participants several questions to determine a participant’s eligibility. If your child is interested in participating in this study, please email ashley.nielsen@wustl.edu with a phone number you can be reached at.
